S 2465-2

ILLINOIS POPULATION TRENDS FROM 1970 to 2025

1982 Edition

State of Illinois
Bureau of the Budget
July 1982

STATE OF ILLINOIS
EXECUTIVE OFFICE OF THE GOVERNOR
BUREAU OF THE BUDGET
SPRINGFIELD 62706

To The Reader:

This book contains population projections for the State of Illinois and its constituent counties. These projections reflect the probable trends of population growth, changes in age composition, and other population characteristics in the State. They provide a crucial demographic foundation from which a broad spectrum of planning policies and programs can be meaningfully based.

Based upon a proven technique, these projections have been developed utilizing actual historical information and the final 1980 Census count. They are to serve as the official source of population data and are to be used whenever appropriate by all State agencies, boards and commissions. Variations from these projections must be submitted to the Division of Planning and Financial Analysis located in the Bureau of the Budget with detailed supporting information and be approved prior to use.

Thank you for your consideration.

Respectfully submitted,

Robert L. Mandeville
Director
Bureau of the Budget

These projections have been prepared by Scott M. Kimmel under the general direction of Dr. Cheng H. Chiang and with the assistance of Eric Albin, Steve Sherer and Steven Hwung of the Division of Planning and Financial Analysis, Bureau of the Budget.

Please address all questions relating to these population projections to:

Dr. Cheng H. Chiang or Scott M. Kimmel
Division of Planning and Financial Analysis
Illinois Bureau of the Budget
605 Stratton Building
Springfield, Illinois 62706
Telephone: 217/782-5414

This publication has been financed in part through a manpower planning grant from the Department of Commerce and Community Affairs pursuant to provisions of Section 106 of the Comprehensive Employment and Training Act of 1973.

IV. Appendix 1: Methodology 233

ILLINOIS POPULATION TRENDS

Introduction

Since 1973 the Illinois Bureau of the Budget has published uniform, most probable projections of demographic characteristics for the State. Mandated for use as guidelines for all agencies, boards and commissions of State government, these projections have also been utilized by a variety of sub-state regional planning organizations and local governments, as well as by many private industrial groups.

This volume, the seventh in the series, incorporates total population counts from the 1980 Census and the latest available data concerning trends of fertility, mortality, labor force participation rates, and employment growth. Consequently, the population projections presented herein are updated versions of those projections published in June 1981. Differences between the two are primarily caused by changes in the estimates and projections of employment levels. However, revised population estimates for the 1970s and the projected migration patterns based on the 1980 Census have also contributed in the updating of these population projections. A detailed description of the assumptions and methodology used in making the projections is contained in Appendix I.

Data Revisions and Current Population Projections

The 1980 Census of population has served as a new data base for population projections and provides an essential clue to the most probable population trends of the next decade. Due to improved census procedures, the undercount resulting from the 1980 Census was substantially lower than in previous censuses taken. This reduced undercount has been credited for slightly increasing the population projections for the State. Also apparent in the population projections completed since the 1980 Census data became available is a reclassification of a large proportion of people of "Spanish Origin" from "white" to "nonwhite." This adjustment is noticeable as an uncharacteristically large increase in the rate of growth of nonwhites between 1970 and 1980. This reclassification, together with the availability of population data by age, served as a new base for projecting migration patterns. As a result, the age compositions of the current population projections are somewhat different from those previously published.

Final estimates of employment for 1979 and preliminary estimates for 1980 by industry were available for use in the current population projections. Prior to this time, preliminary 1979 data served as the latest observation of employment trends. The final employment estimates for 1979 were different from the preliminary estimates for the same year. This, together with a moderate employment growth as revealed in the 1980 preliminary employment estimates, has resulted in new levels of projected employment.

Barring catastrophies or drastic technical and economic changes affecting the Illinois and U.S. employment and population distribution, the current population projections represent the State's most probable population trend and should provide a sound basis for future planning.

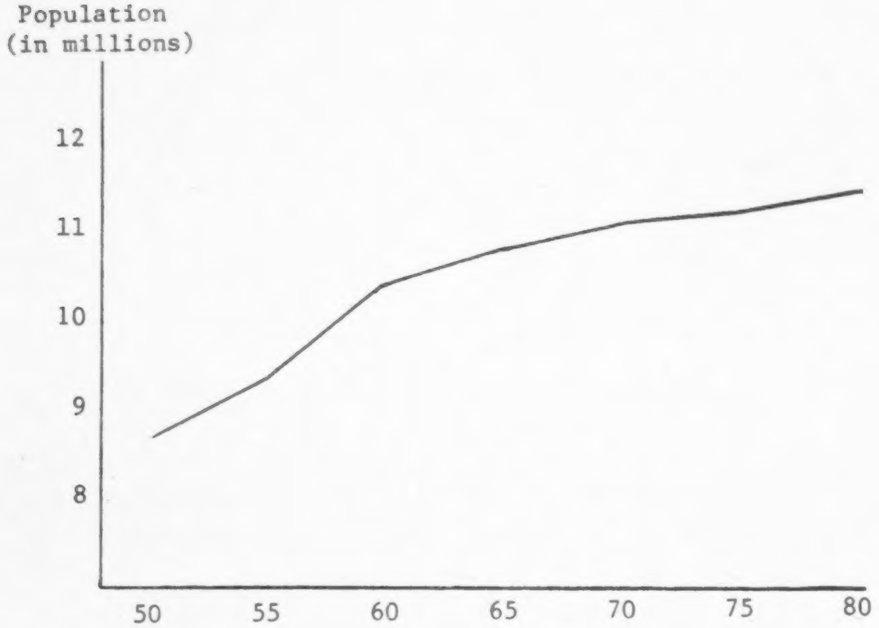
Historical Population Trends in Illinois, 1950-1980

To understand future population trends in Illinois, it is necessary to examine historical trends for population growth and demographic characteristics in the future are to a large measure governed by those of the past.

As Figure 1 illustrates, from 1950 to 1980, Illinois' population grew rapidly from 8.8 to more than 11.4 million. During these three decades, Illinois' total population grew 29.5%. Much of the growth, however, took place in the period 1950-1970 during which an increase of 26.1% was recorded. Illinois' population remained relatively stable from 1970 to 1980. The 1980 census of population shows that Illinois population increased by only 2.8% from 1970 to 1980. It should be stressed that this percentage increase over the ten years is somewhat inflated, due to the 1970-1980 change in undercount. Were it not for the improvement in population undercount in the 1980 census, an increase of around 1.2 rather than 2.8 percent would most likely have been observed.

Figure 1

ILLINOIS OPEN POPULATIONS: 1950-1980

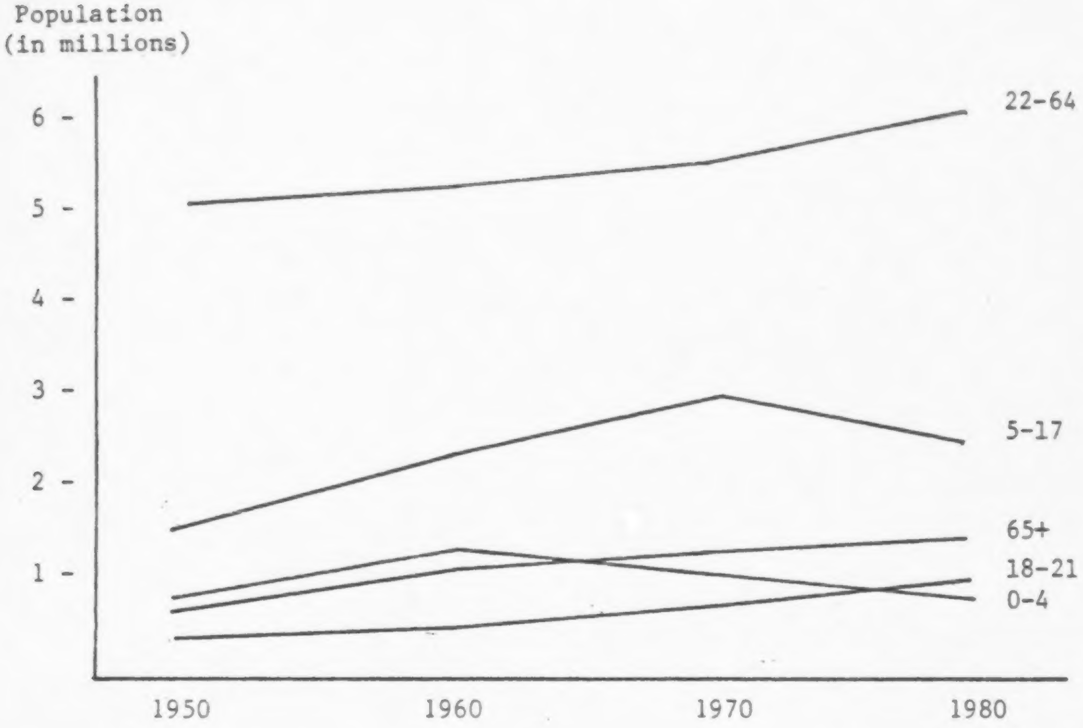


Since population growth or decline is a function of deaths, births and net migration, the historical trends reflect changes in these three components. Between 1960 and 1970, Illinois lost 43,000 persons in net migration; yet due to an increase of births over deaths, population growth during that time was over 1 million persons. Since 1970, however, net out-migration has accelerated to such an extent that it has offset the natural birth-death surplus, causing a virtual stabilization of total population since 1972.

The small overall increase in population does not imply that each age group has experienced an increase in size. Certain age groups have experienced decreases in their population sizes. Figure 2 depicts the profile of historical changes in population sizes for 5 broad age groups in Illinois.

Figure 2

POPULATION OF SELECTED AGE GROUPS, ILLINOIS: 1950-1980

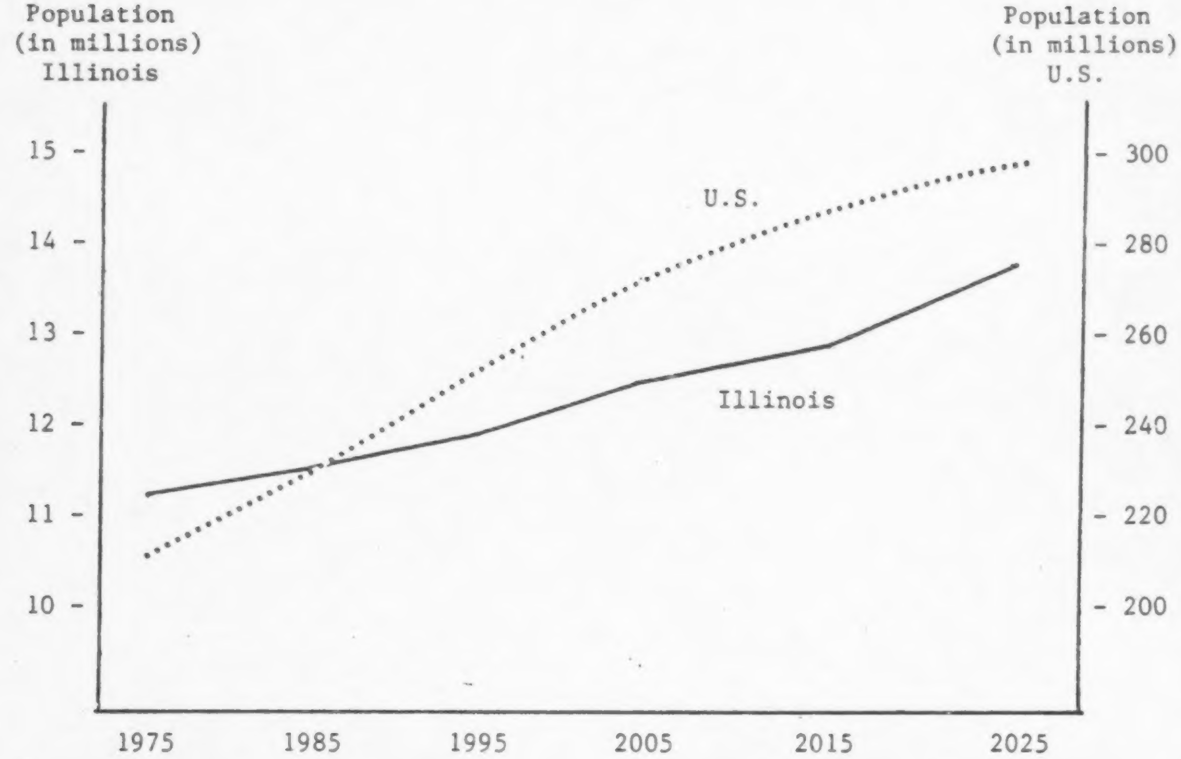


Future Population Trends in Illinois

The historical trends in population size and age structure provide essential clues to the question of what future population size and age compositions are likely to be. Figure 3 depicts the projected populations of the State of Illinois and the U.S., at five-year intervals, until the year 2025.

Figure 3

POPULATION TRENDS IN ILLINOIS AND U.S.: 1975-2025



A comparison of the Illinois data with U.S. projections reveals that Illinois' lag in population growth relative to the rest of the country is expected to continue and deepen through 2000. During the 25-year period from 1975-2000, the population of Illinois is expected to increase about 9.8%, while the U.S. population will increase about 21%. However, this slower growth does represent a gain of approximately 1 million people.

Within these overall figures, the age and sex distribution of the population will change substantially. To illustrate this change, Figures 4, 5, and 6 show the age/sex "pyramids" for Illinois in 1970 and projected pyramids for the years 2000 and 2025. An age/sex pyramid illustrates the percent of population accounted for by each age/sex group during the year presented. For example, in 1970, males aged 10-19 accounted for 9.7% of the population of Illinois.

As Figure 4 illustrates, the age distribution of the Illinois population during 1970 reflects a large percentage of the population among younger age groups, graphically represented by the large base. A natural decrease is reflected in each succeeding age group forming the pyramid. Two anomolies stand out. The age cohort representing those individuals who were 30 to 40 years old in 1970 is smaller than one might expect, reflecting extremely low fertility rates evident during the Great Depression. In addition, the 0 to 10 age cohort is smaller than the 10 to 20 cohort, resulting from the decline in fertility rates during the period 1960 to 1970.

As Figure 5 illustrates, the age/sex distribution for the year 2000 in Illinois will be substantially different. By this time, the pyramid will have become more "cylindrical" as a result of lowered fertility rates. As births continue to account for less and less of the population the median age of the State will continue to rise.

By the year 2025 (Figure 6) the continuing effects of these phenomena show that the age distribution of the population will have changed significantly. The age distribution will be approximately static as births continue at a replacement level. Unless fertility rates undergo a dramatic change, the age/sex pyramid should stabilize in Illinois between the years 2000 and 2025.

ILLINOIS PROJECTED OPEN POPULATION: 1970

AGE-SEX DISTRIBUTION

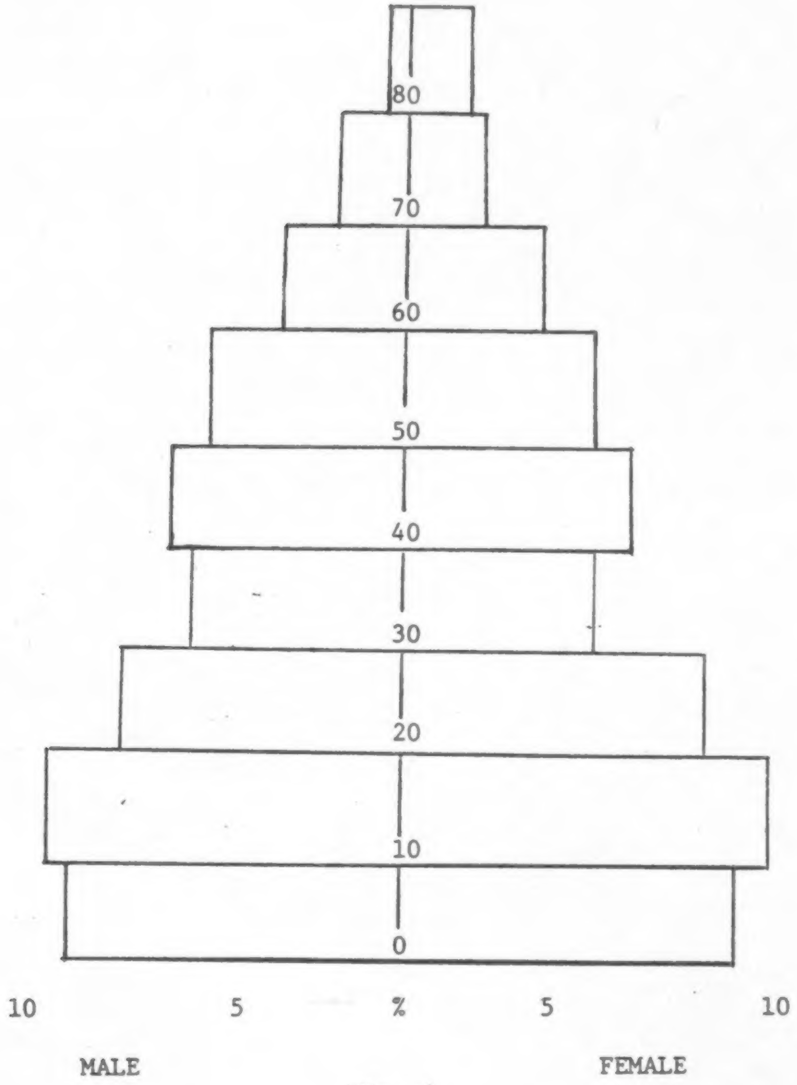


Fig. 4

ILLINOIS PROJECTED OPEN POPULATION: 2000

AGE-SEX DISTRIBUTION

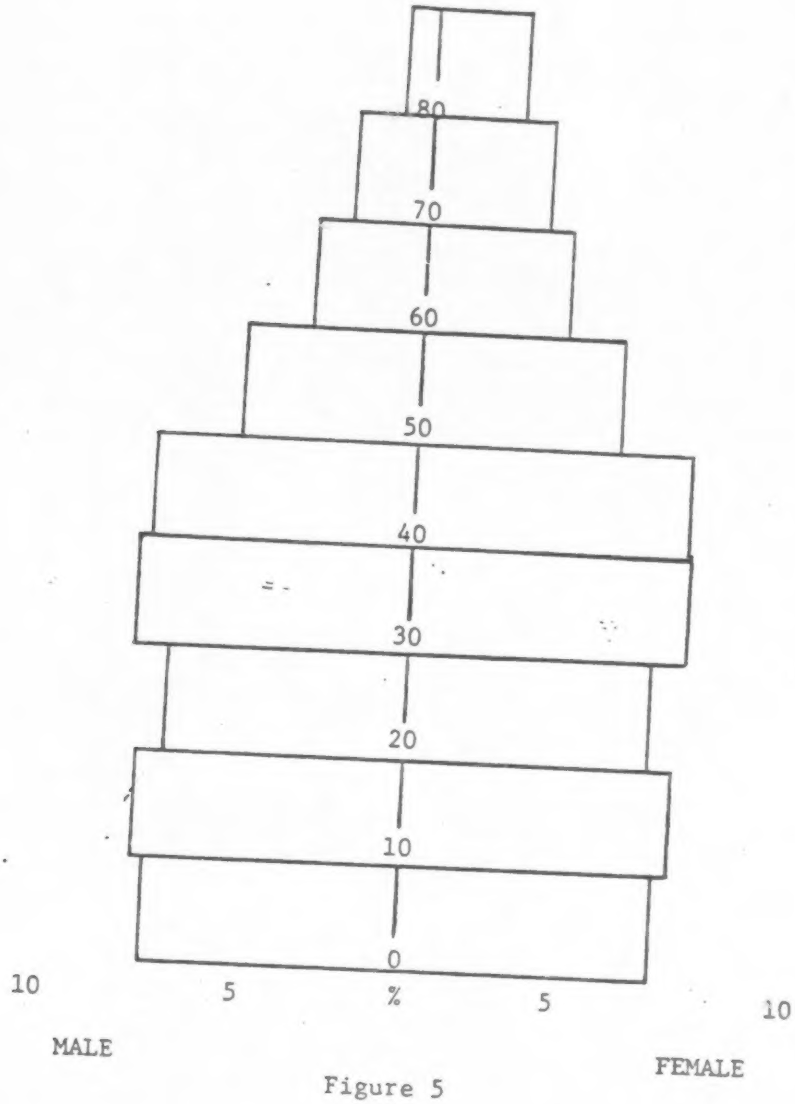

Figure 5

ILLINOIS PROJECTED OPEN POPULATION: 2025

AGE-SEX DISTRIBUTION

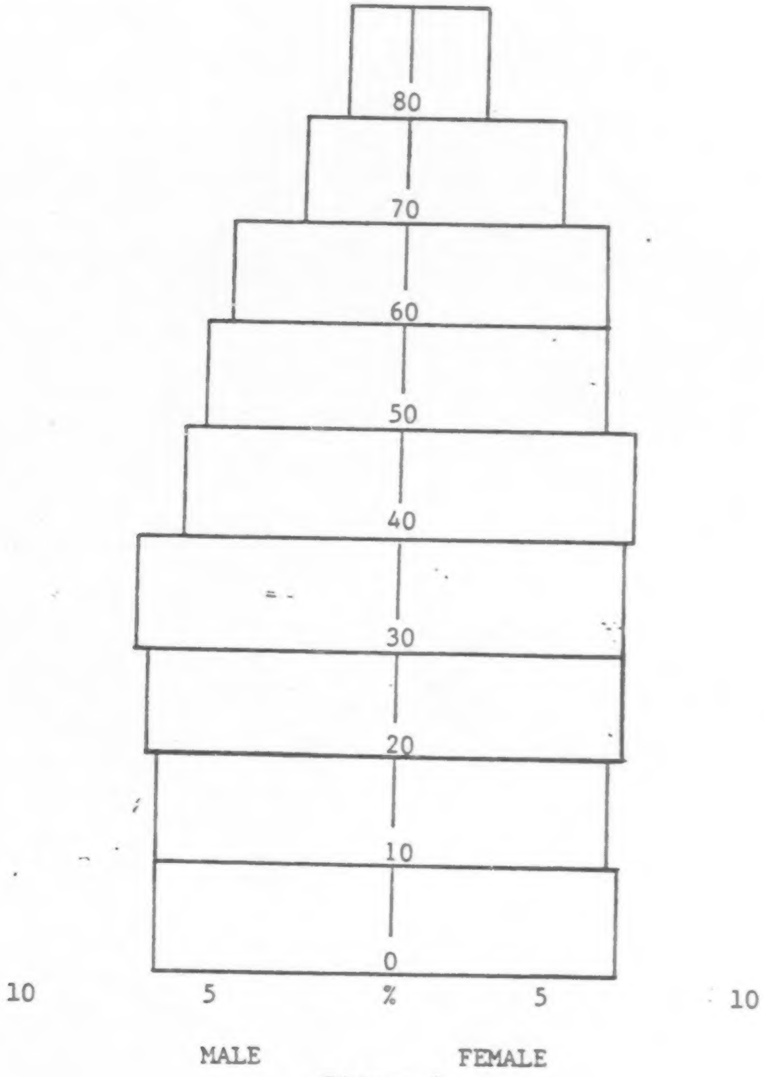

Figure 6

Demographic information based on age breakdowns as shown in the pyramid is not specific enough for many planning purposes. Moreover, projections to the year 2025 may seem remote for current government policy. For both State and local governments, significant shifts in the size of four population groups in the next two decades are perhaps of particular importance: school aged children, young adults, the working population, and the elderly. The following sections illustrate changes that these groups will undergo during the period 1980-2000.

The School Aged Population

The number of school aged children increased steadily in Illinois from 1950 to 1972. Since then it has dropped considerably and will continue to do so at least until the late 1980s (Table 1 and Figure 7). The expected downward trend is mainly associated with the continuous decline in the number of people aged 0-4 in the 1970s. An increase in the age cohorts 5 through 17 is expected from 1990 to 2000, partially because more children will be born to the sizeable number of childbearing women in the "baby boom" cohorts in the early 1980s. However, the number of persons aged 5-17 in the 1990s will still be smaller than that in 1980. Except for a more rapid rate of growth from 1985 to 2000, a similar pattern of changes in the school aged population is also expected for the U.S. (Figure 7).

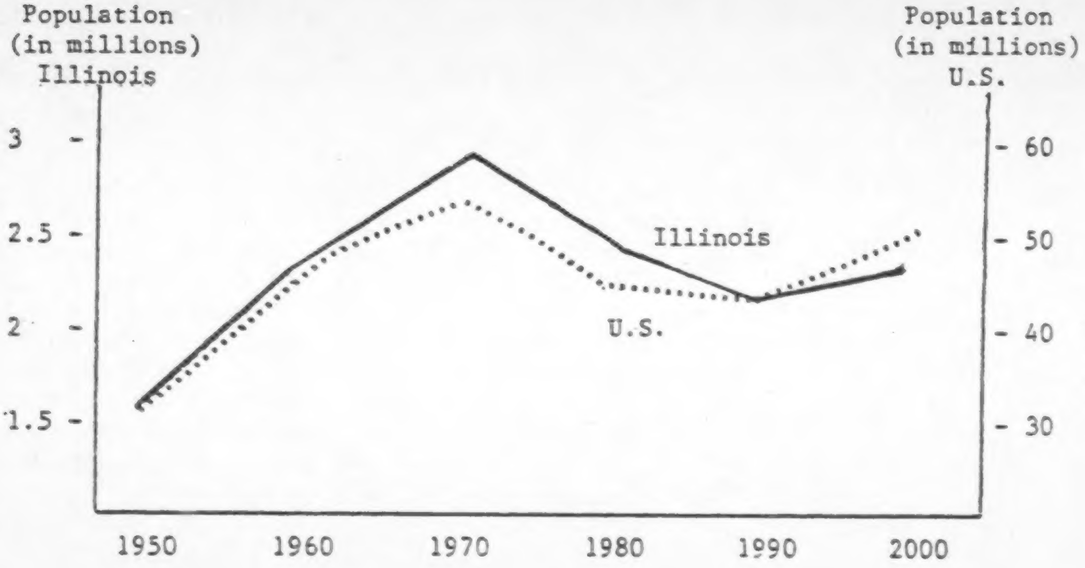
Table 1

NUMBER OF SCHOOL AGED CHILDREN BY AGE, ILLINOIS: 1970-2000

		Population	
Year	Total	5-13	14-17
1970	2,864,075	2,017,007	847,068
1980	2,402,425	1,579,082	823,343
1985	2,242,065	1,489,136	752,929
1990	2,204,058	1,513,573	690,485
1995	2,262,891	1,598,813	664,078
2000	2,315,092	1,603,107	711,985

Figure 7

SCHOOL AGED POPULATION, ILLINOIS AND U.S.: 1950-2000



Young Adults

From 1960 to 1975, the population aged 18-21 increased by 72% for Illinois. However, population in this age group has started to decline and will continue to do so until 1995 (Table 2 and Figure 8). By 1995, Illinois will have only 682,516 young adults, approximately 46,000 fewer than that for 1970. A similar pattern of change has also been projected for the U.S. by the Bureau of the Census (Figure 8).

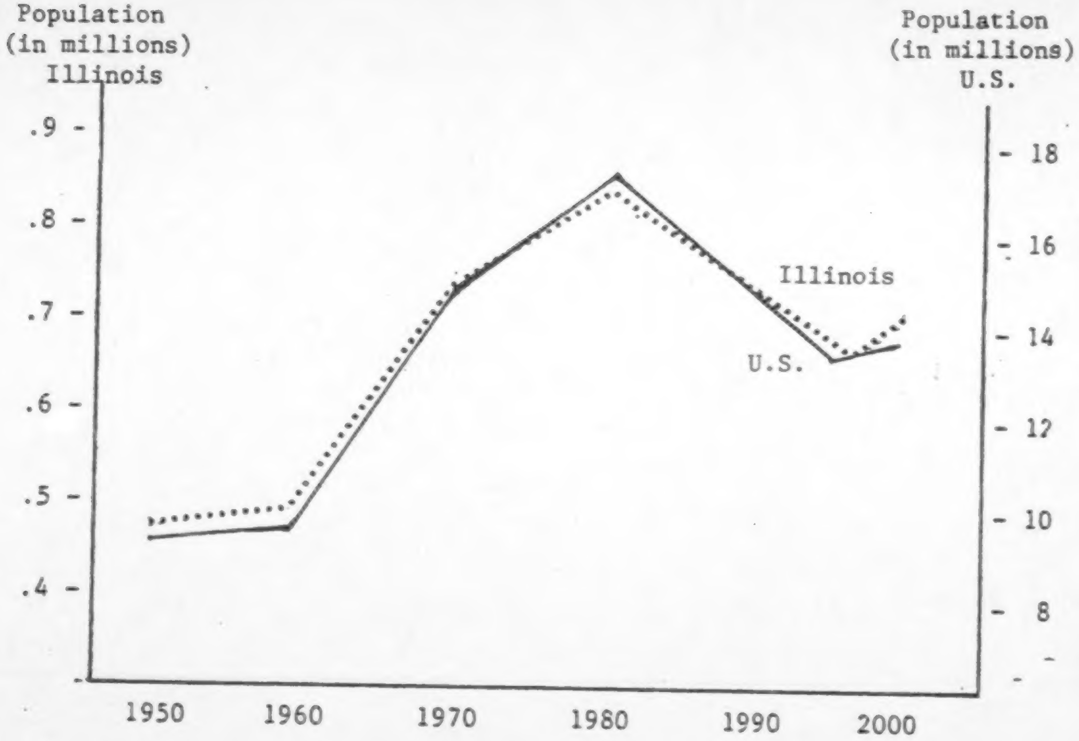
Table 2

NUMBER OF YOUNG ADULTS, ILLINOIS: 1970-2000

Year	Population
1970	728,251
1980	867,872
1985	810,015
1990	740,683
1995	684,436
2000	688,198

Figure 8

YOUNG ADULT POPULATION, ILLINOIS AND U.S.: 1950-2000



The decline in the young adult population will not only affect the number of college enrollments, but may also lead to lower young adult unemployment rates and lower incidences of crime. Whether these anticipated effects will materialize depends upon future economic growth, the criminal justice system and other socio-economic factors.

The Working Population

The age group 22-64 represents the majority of the members of the labor force. The size of the labor force is governed by the number of people in this age group, and the participation of that group in the labor force. As Table 3 and Figure 9 illustrate, the population aged 22-64 will continue to climb for Illinois. While the total population is expected to increase by only 10.5% from 1970-2000 in Illinois, the age group 22-64 is expected to jump from 5.5 to 6.9 million, an increase of nearly 25%. However, the percent increase is far less than that for the nation as a whole. An increase of more than 45 percent during this period has been projected for the United States by the Bureau of the Census (Figure 9).

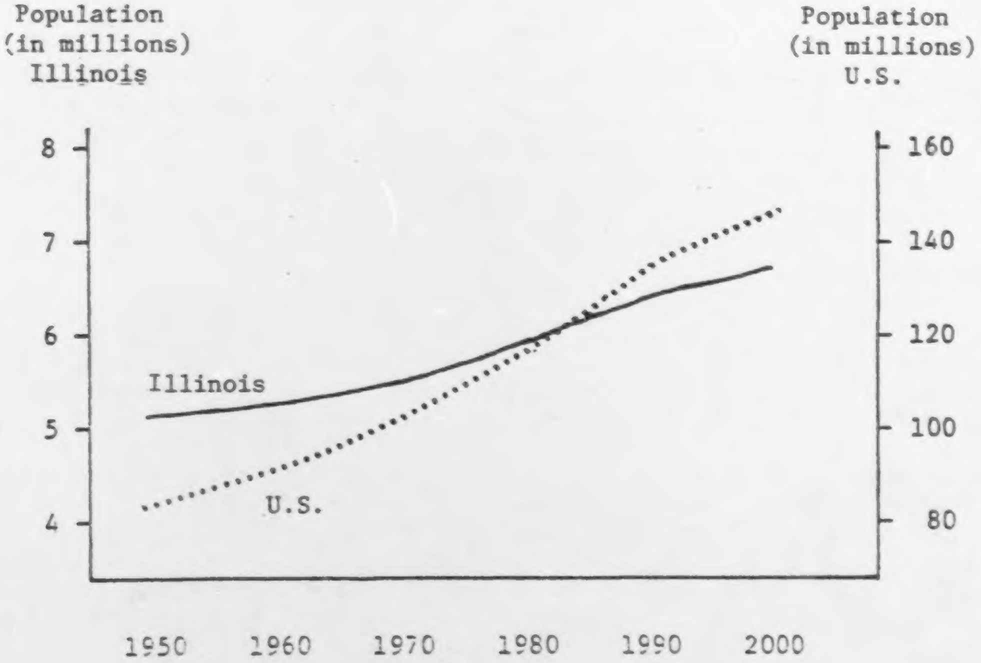
Table 3

POPULATION AGED 22-64, ILLINOIS: 1970-2000

Year	Population
1970	5,508,211
1980	6,058,259
1985	6,319,719
1990	6,489,310
1995	6,673,326
2000	6,884,588

Figure 9

POPULATION AGED 22-64, ILLINOIS AND U.S.: 1950-2000



This large relative increase in the 22-64 age group should have several positive outcomes for the Illinois economy. The labor force will be more mature than that found in the 1970s, with more work experience. This should tend to lead to productivity gains. Also, since earning power generally rises with age and experience, workers should earn more. This, of course, will yield increased economic benefits to all sectors of the Illinois economy, including state government. While overall economic growth, the occupational makeup of the labor force, and other factors complicate the relationship between State revenue growth and changes in the size and maturity of the State's labor force, the large maturing labor force should suggest a strong state government revenue base within the existing tax structure.

The Aged

Since 1950, the number of people in Illinois over the age of 65 has grown from over 750,000 to more than 1.15 million in 1975. If current population trends hold, by 2000 there will be 1.55 million persons over the age of 65 residing in Illinois, an increase of more than 34% (Table 4 and Figue 10). This percent increase is less significant than that for the nation as a whole. The number of elderly in the U.S. will increase from 22 million to 32 million from 1975 to 2000, an increase of 45 percent.

Table 4

POPULATION AGED 65 AND OVER, ILLINOIS: 1970-2000

Year	Population
1970	1,095,721
1980	1,262,632
1985	1,363,079
1990	1,464,651
1995	1,533,583
2000	1,550,344

From 1950 to 1975, we have experienced not only an absolute increase in the number of aged individuals in Illinois, but also an increase in their percentage of the total population. The same thing can be said for the future (Figure 11). In 1970, persons over 65 constituted 9.9% of the Illinois population; aged individuals are projected to grow to over 12.6% of the population by the year 2000.

Figure 10

POPULATION OVER 65 YEARS OLD, ILLINOIS AND U.S.: 1950-2000

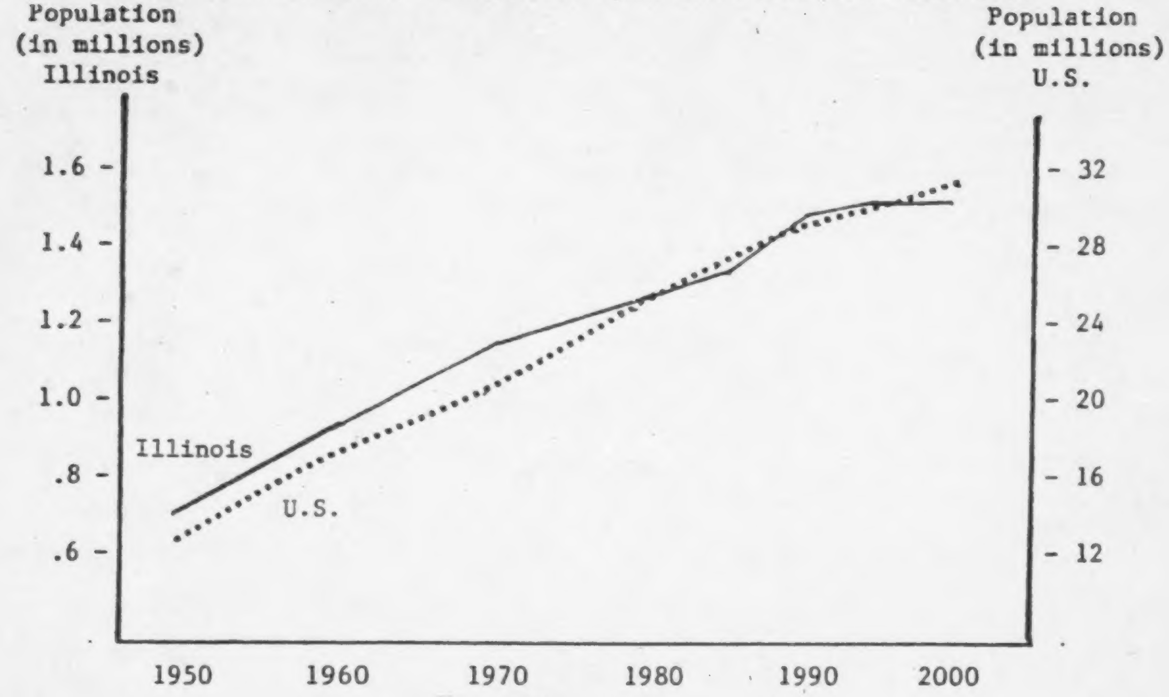


Figure 11

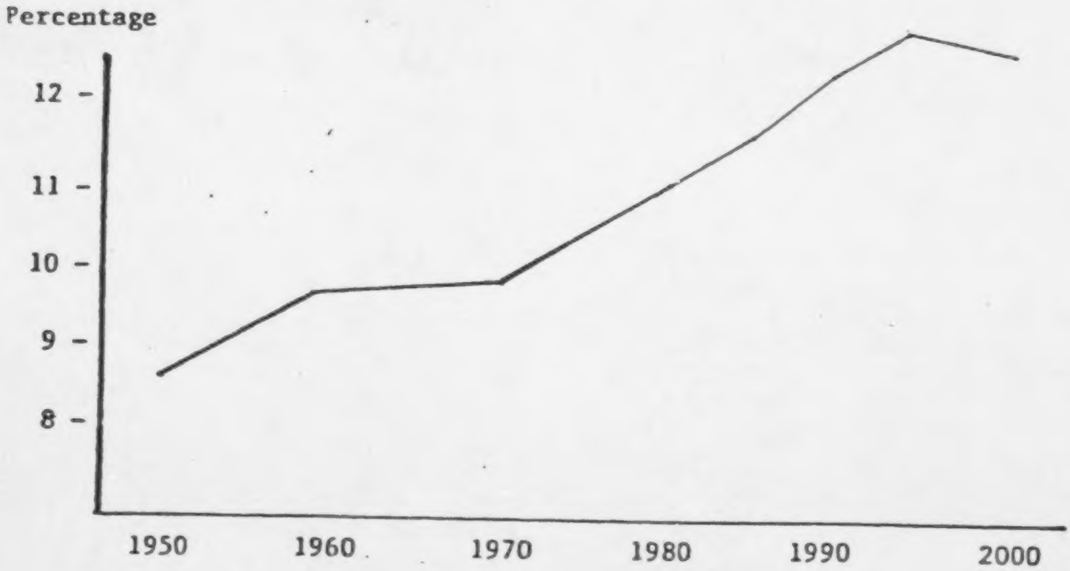
AGED POPULATION AS A PERCENTAGE OF ILLINOIS TOTAL POPULATION: 1950-2000



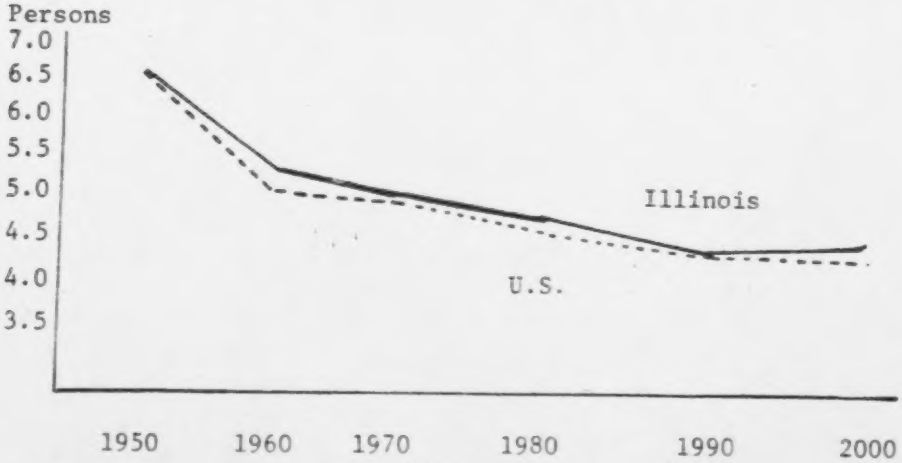
Clearly, there will be an increase in demand for government services for the aged over the next 20 years. By the year 2000, the median age of the population of the United States will have shifted from 28.8 years in 1975 to 34.8 years of age. A similar shift will take place in Illinois, with the median age in the year 2000 estimated to be 35.8. This shift in the median age of the population will likely cause similar shifts in demand for a variety of government services. For example, the needs for long term care and other health care services for the chronically ill will likely expand as the aged population increases. In addition, the overall need for income maintenance and social services for the elderly - whose earning power has traditionally lagged behind the rest of the population - will increase if living conditions among senior citizens are to be maintained or improved. As the number of those over 65 in Illinois increases from 1,262,632 in 1980 to 1,533,583 by the year 1995, additional government resources will most likely be called upon to meet their needs.

Can resources produced by the prime-earning age population finance services necessary to support the increasing number of aged population? The future trend of the ratio of population aged 22-64 to those over 65 may provide us with a clue to the question.

For both Illinois and the U.S., the ratio has declined steadily from 1950 to 1970 (Figure 12). Illinois and the U.S. had almost identical numbers of persons aged 22-64 per aged individual in 1950 and 1960. Beginning in 1970, however, the ratio began to be in favor of Illinois. In 1980, Illinois had a ratio of 4.80 as compared to 4.77 for the United States. While almost no change in the ratio is expected for Illinois in the next two decades, a steady decline in the ratio for the U.S. has been projected by the Bureau of the Census. As a result, the number of persons aged 22-64 per aged individual for the United States will continue to lag behind that for Illinois. The future discrepancy in the ratio between Illinois and the U.S. is mainly accounted for by a more rapid growth in population over 65 in the U.S. relative to that in Illinois. The slower growth in population over 65 in Illinois may be associated with migration of the elderly to the sunbelt regions. Thus Illinois will have a more solid base of working people with which to provide services to the elderly than the U.S. as a whole.

Figure 12

RATIO OF PERSONS AGED 22-64 TO PERSONS AGED 65 AND OVER
U.S. AND ILLINOIS: 1950-2000



Summary

These population projections indicate that the future of Illinois will be strongly influenced by the following trends:

- moderate and continuing growth in population;
- decreased school aged population until 1990, with moderate growth in school aged population thereafter;
- young adult population will decline until 1995, with moderate growth thereafter;
- continuing increases in absolute numbers and percentage of the aged in the population; and,
- Illinois will have a more solid base of working people with which to provide services to the elderly than the U.S. as a whole.

APPENDIX 1

METHODOLOGY

It is well known to demographers that large populations can be more accurately projected than smaller ones, all else being equal. Therefore, the basic projection system utilizes a general step-down procedure. That is, population projections were first made for the State of Illinois, then for sub-state regions within the State, then for counties within the regions. At all times, the sum of the counties' projections were forced to equal the regions' totals, and the regions were forced to equal the State's projections.

The fifteen sub-state economic regional boundaries were delineated by grouping the counties into economically unified aggregates. The Standard Metropolitan Statistical areas (SMSA's) and their adjoining less populated areas formed the basis for nine of the regions. The other six were defined as broad, non-metropolitan areas having similar economic infrastructures and tending to form analytically significant economic and demographic entities. While any number of regions with a multitude of boundary variations could have been drawn, these fifteen were considered to be sufficiently large so as to promote accuracy, yet sufficiently disaggregate so that each region did, in fact, represent a basic economic and social unit. For each of these economic regions and their constituent counties, population projections by age and sex have been prepared according to the following procedures.

Assumptions

- Economic assumptions for the U.S. are those of the Bureau of Labor Statistics in their Structure of the U.S. Economy to 1985 series. The specific model used assumed a national unemployment rate of 5.5 percent by 1985.

- National fertility rates assumed to be in effect are the Series II rates of the Census Bureau. National mortality rate trends utilized are also those of the Census Bureau.

- There will not be any water shortages in Illinois that might inhibit industrial and population growth.

- The possible construction of the Illinois-St. Louis airport near Waterloo, Illinois, two potential coal gasification plants in southern Illinois, and a gas pipeline from Canada down through the upper Midwest into Illinois were not included in this projection series. If any of these projects are constructed, it is likely considerable economic activity will result. These activities would likely result in increased numbers of people, the total of which would be dependent upon the magnitude of the project.

In developing population, labor force, and migration parameters, the following data sources have been used as the primary sources.

- Data for 1970 is from the 1970 Census of Population Census Bureau Current Population Reports p-20, p-23, p-25, p-26, p-27 were utilized to update the basic data for the intervening years 1970-78. Data derived from the 1980 Census were utilized to update the previously projected 1980 total population for state and each county. Census of population data reflects the situation as of April 1 of the decade year. Since all intermediate population data are estimated as of July 1, the precise decennial Census values will not match the historical data shown on these projections.

- Labor force participation rates by age, sex and race for Illinois and its constituent counties were projected on the basis of the most current projected rates by the Bureau of Labor Statistics.

- Historical data on deaths by age and sex, and births by age of mother in Illinois are available from State vital statistics reports prepared by the Illinois Department of Public Health. Census Bureau Current Population Reports p-25 was utilized to estimate future age-specific fertility and mortality rates in Illinois.

- Net migration patterns by age and sex by county between 1975 and 1980 were estimated by comparing the derived estimated (1980) closed populations with the revised open populations for 1980.

Industry Employment

Employment opportunities are assumed to be the driving force for migration. Considerable emphasis and care was taken in the development of the industrial projections for the State and sub-state regions. In general, the projections have been developed using shift-share technique in regression format.

1. Historical data on one- and two-digit SIC industries from 1952-1979 for the U.S., Illinois, Chicago and Peoria SMSA's were utilized for the regression analysis. These data were derived from Employment and Earnings. Illinois and the SMSA's share of U.S. employment were regressed on time variables. The regression results were carefully examined for "goodness of fit." In cases where the employment shares were found to not be a function of time, the estimated slopes were not used for deriving the projections of employment involved.

2. The estimated slopes with reasonable goodness of fit, combined with the projected industry employment in the U.S., yield the projected employment in most of the two-digit and all of the one-digit SIC categories for Illinois and the SMSA's.

3. Thus projected employment trends were modified to account for the most recent (1979) employment estimates. This was necessary to account for new plant openings and closings.

4. The future employment for the two-digit SIC industries having unreliable slopes was estimated by disaggregating the remainders between the projected one-digit employment and its constituent two-digit employment. In disaggregating the remainders, the proportionate employment share of each estimated two-digit industry among the remainders was assumed to be the same as that in 1980, and was used as an allocator.

5. A balance of state component was derived by calculating the expected growth differential between the State and the sum of the Chicago and Peoria SMSA's.

6. In allocating the balance of state estimated employment to each region, employment shares of the major industries in 1980 were used as allocators.

7. A modified shift-share analysis was used to project regional growth for each of the 51 industries.

8. The regional projections were forced to equal the state industrial totals and re-summed to 51 industries.

9. County projections were produced in a similar manner as described in steps 6-8.

The historical data series on industry employment by county has been derived from: unpublished State data for unemployment compensation insurance covered employment; independent Bureau of the Budget projections; County Business Patterns; Dun and Bradstreet; Illinois Manufacturers Directory; and other Federal and State government sources.

Population and Labor Force

Projections of population and labor force by region and county have been derived through the use of the cohort-survival method in which the three components of population change (births, deaths, and net migration) are projected separately. This approach consists of the following elements:

1. The natural increase in regional population is estimated using age-race-sex specific fertility and mortality rates. Observed regional fertility rates are divided by national rates to obtain local/national fertility ratios. These ratios are multiplied by projected national fertility rates to obtain projected regional fertility rates. These rates are multiplied times the number of females in child-bearing age cohorts to obtain number of births. Projected deaths are found via similar age-race-sex specific ratios. Projected national cohort fertility rates are assumed to be the current Census Bureau Series II projections and national mortality rates to be the current national rates by age, race, and sex.

2. This natural increase in population yields an estimate of the "closed population" for the next five-year period. That is, the closed population is composed of the original population with each cohort group aged five years, plus expected births, minus deaths.

3. To the closed population must be added the net migration. Net migration is viewed as, and is projected from the standpoint of being, the social phenomena that equates a balance between labor force supply and labor force demand.

4. Labor force supply is estimated from the closed population. The sex and race specific age cohorts of the closed population yields labor force age population; i.e., those persons in age categories that are eligible to seek jobs. Labor force participation rates are projected in a manner similar to the fertility and mortality rate projections. These projected labor force participation rates are applied to the labor force age population to estimate the actual labor force supply.

5. Labor force demand is estimated on the basis of projected total employment, dual job holdings, unemployment, and net commutation. The total labor force for the base year is used as the starting point. From this count, the number of people serving in the armed forces is subtracted, as it is felt they are not subject to the same market constraints as the rest of the economy. From this number, the unemployed are taken out to yield civilian job holders. This number is divided by the number of jobs for the region to derive the ratio of people employed to employment. This ratio is used to account for dual job holdings and net commutation. Then the ratio is multiplied by the employment projection to yield an estimate of future labor force demand, to which unemployment and armed forces projections are added. The number yields the total labor force demand for the projection year.

6. Labor force supply and labor force demand are compared to derive a measure of either labor oversupply (leading to net out-migration) or labor shortage (contributing to net in-migration). To in- or out-migrate sufficient labor force age population to balance out the supply and demand, the difference in supply and demand as a proportion of the total labor force is applied to the closed population. This yields total net migration. A shift-share algorithm is then used to break down the age, race, and sex components according to past migration patterns.

7. The age, race, and sex elements of the estimated net migration are then added to, or subtracted from, the closed population to obtain the regional open populations.

8. Counties are projected in a similar manner and justified to regional totals.

9. This procedure is reiterated for each five-year period to obtain the series of projections.
